Air Canada to partner in biofuel initiative

Air Canada will participate in Canada's Biojet Supply Chain Initiative (CBSCI), a three-year collaborative project with 14 stakeholder organizations to introduce 400 m3 (105,669 gallons) of aviation biofuel into a shared fuel system at a yet-to-be determined Canadian airport.

According to the Canadian flag carrier, its previous biofuel flights used biojet that was segregated and loaded separately into an aircraft via tanker truck. By contrast, it said CBSCI's objective is to start developing a more efficient operational framework that will introduce biojet into a multi-user, co-mingled airport fuel supply system.
